

My project was intended to be an application for new and old hockey fans alike. The idea was to have an interactive application that a user can see schedules, look at team information, have basic questions answered and for fun a goal horn that would sound when you clicked the jersey. I also wanted to have the ability to show the team logo on pucks with a vs in between when you clicked on a schedule game.

Unfortunately I think I was a little ambitious with what I wanted to do and with what time I had. I was able to get a lot of the coding done and the website doesn't look bad, but some of the java script functions aren't working, and not everything turned out like I had hoped.

Going forward I would like to finish this application to what I had designed, and maybe moving forward I can take this in directions of different sports or activities. I even started of thinking about a way to work fallout 4 into it. I am hopeful that I got enough things into this application for a decent grade even though the functionality wasn't there like I had hoped. I did enjoy the class and will continue to work on the skills I learned in this class.
